Bernard Rosner : Fundamentals of Biostatistics (with Data Disk) before purchasing it in order to gage whether or not it would be worth my time, and all praised Fundamentals of Biostatistics (with Data Disk):

I just photocopied the few new pages in the current edition and have been using this older edition. 0 of 0 people found the following review helpful. Five Stars By Isaacgood 16 of 17 people found the following review helpful. Comprehensive introduction to biostatistics By M. Ching This book isn't for everyone, but if you want a wide ranging textbook with a little more mathematical detail than the other intro books, this is a great choice. Rosner explains concepts well and with many examples that help the reader to understand them. The flowcharts at the back of the book were written to help readers choose the right test for the right situation, and these are extremely valuable. The only problem with the book is that it is sometimes hard to sit down and read it without any preparation (e.g., lecture or prior knowledge).

Bernard Rosner's FUNDAMENTALS OF BIOSTATISTICS is a practical introduction to the methods, techniques, and

computation of statistics with human subjects. It prepares students for their future courses and careers by introducing the statistical methods most often used in medical literature. Rosner minimizes the amount of mathematical formulation (algebra-based) while still giving complete explanations of all the important concepts. As in previous editions, a major strength of this book is that every new concept is developed systematically through completely worked out examples from current medical research problems.

About the Author Bernard Rosner is Professor in the Department of Medicine, Harvard Medical School, and the Department of Biostatistics at the Harvard School of Public Health. Dr. Rosner's research activities currently include longitudinal data analysis, analysis of clustered continuous, binary and ordinal data, methods for the adjustment of regression models for measurement error, and modeling of cancer incidence data.
