Moving beyond the strict boundaries of tissue and cell histology, "Histology for Pathologists" focuses on the borderland between histology and pathology - frequently the most problematic of territories for the pathologist. In this guide, international specialists in pathology, histopathology, anatomical pathology, surgical pathology, and neuropathology describe in detail the histologic structure, composition and function of tissues from the perspective of most value to the pathologist. Each of the major organ systems is systematically reviewed - additional coverage provided on structures of special significance - encompassing in the 48 chapters; the cardiovascular system; the spleen; reactive lymph nodes; the central and peripheral nervous systems; the endocrine and neuroendocrine systems; the gastrointestinal system; the kidney; the male and female urogenital systems; the respiratory system; bone, muscle, and connective tissue; the eye; the ear; skin; and nail. In most chapters, frequently encountered prepathologic conditions are examined as well as fully developed pathologic alterations.
