Develop A Deeper UnderstandingBy Stephen PellerineThis is truly a great book with a nice overall organization and plenty of diagrams and figures to help you out as a reader. I simply enjoy a good reference book and bought this as a runner to better understand the physiology/histology of running. My main aim was to gain a better understanding of the mitochondria and oxidative phosphorylation which it addresses nicely. I am not saying this addresses running at all - but if you are a coach or exercise enthusiast that have come across concepts relating to histology (i.e the Mitochondria and ATP) this book will help you develop a deeper understanding, I think, of these concepts. It does help me - but I simply enjoy such reading.So - depending on your

specific interests and background this is obviously a very specialized book not intended as a NYT best seller, but is a very wonderful resource for folks interested in the cellular side of biology. 0 of 0 people found the following review helpful. Four Stars By Arsenal... Arsenal Very readable summary of basic/introductory "one cell" cell biology, w/ clinical cases scattered throughout. 0 of 0 people found the following review helpful. Medical Cell Biology, Third Edition, focuses on the scientific aspects of cell biology important to medical students, dental students, veterinary students, and prehealth undergraduates. With its National Board-type questions, this book is specifically designed to prepare students for this exam. The book maintains a concise focus on eukaryotic cell biology as it relates to human and animal disease, all within a manageable 300-page format. This is accomplished by explaining general cell biology principles in the context of organ systems and disease. This updated version contains 60% new material and all new clinical cases. New topics include apoptosis and cell death from a neural perspective; signal transduction as it relates to normal and abnormal heart function; and cell cycle and cell division related to cancer biology. 60% New Material! New Topics include: Apoptosis and cell death from a neural perspective Signal transduction as it relates to normal and abnormal heart function Cell cycle and cell division related to cancer biology All new clinical cases Serves as a prep guide to the National Medical Board Exam with sample board-style questions (using Exam Master(R) technology): www.exammaster.com Focuses on eukaryotic cell biology as it related to human disease, thus making the subject more accessible to pre-med and pre-health students
